EXECUTIVE SUMMARY / ONE PAGE

Build loyalty evidence. Test discount reduction.

D2C customer intelligence | Soumabha Bhim

Snapshot	Finding
3,900 customers	$233,081 recorded sales; no reporting period available
Promotion exposure	43.0% of customers; 42.65% of recorded sales
Repeat cadence proxy	1,086 customers (27.85%): 26+ previous purchases and at least monthly cadence
High proxy-value tier	781 customers (20.03%); 25.69% of recorded sales

What founders should conclude

The business has customers with substantial purchase history, but this snapshot cannot establish retention, two-year value or causal discount dependency. Promo and discount flags are identical. All subscribers and all discounted customers are male, making simple segment comparisons confounded.

Three actions

1. Run a controlled sunset pilot. Start with 74 satisfied, established, high-value-proxy promo-exposed customers. After instrumentation, test a 5-percentage-point discount reduction against unchanged offers. Track 90-day contribution and revenue per randomized customer. The cohort is too small to establish sales safety; accrue a powered follow-up before expansion.

2. Test full-price geographic demand. Arizona, Alaska and Tennessee lead the qualified state screen for high spend and low promo exposure. Prioritize small matched-budget tests in Arizona/Tennessee; evaluate Alaska shipping costs separately. Market penetration and incremental CAC are unknown.

3. Acquire on behavior and product affinity. The 103-customer ICP seed combines High tier, frequent accumulated purchasing, satisfaction and a current full-price purchase. Test apparel/footwear quality creative and convenient checkout. Avoid gender exclusions and narrow age targeting.

Economic upside is conditional

Assuming a 15% discount and COGS of 60% of list price, full removal in the 74-customer cohort implies +$945 illustrative gross profit at unchanged volume, or +$693 with 10% volume loss. These are scenarios, not measured or annual savings. Revenue would fall if volume loss exceeded 15%.

Next data: dated order history, actual discount amounts, offer assignment, costs, returns and acquisition spend. Validate loyalty definitions prospectively. Do not use this snapshot to promise future retention.
